# 545 Heads

The probability of n heads in a row tossing a fair coin is  $2^{-n}$ 

#### Input

r lines containing each one an integer number n. The values of r and n are as follows: 0 < r < 10,  $0 < n \le 9000$ .

### Output

Print r lines each with the value of  $2^{-n}$  for the given values of n, using the format:

```
2^-n = x.xxE-y
```

where each x is a decimal digit and each y is a decimal integer with no leading zeroes or spaces.

### Sample Input

```
8271
6000
1
```

# Sample Output

```
2^-8271 = 1.517E-2490

2^-6000 = 6.607E-1807

2^-1 = 5.000E-1
```
